

Energy conservation is connected to every aspect of our business, from the manufacture of our products to how they are packaged and shipped to their use by our customers. As a major promotional product supplier, we have the potential to make a difference in saving energy and combatting climate change. Akran is working towards implementing alternative energies such as point-of-use solar and wind power in our production and manufacturing facilities around the globe. Not only does it reduce dependence on carbon-based fuels, it cuts CO₂, CH₄ and toxic gases emissions from entering our atmosphere.

Energy Star Products

There are many ways to save energy — from designing new buildings to be energy-efficient to purchasing energy-efficient products, to implementing comprehensive energy management across our entire organization. For more than two decades, Akran has improved the energy efficiency of all its operations. We highly recommend and use energy star qualified products to save energy and protect the environment.
